

RECENT FOOD PRICE DEVELOPMENTS IN MOST VULNERABLE COUNTRIES

- ISSUE No 2, DECEMBER 2008 -

This price watch bulletin covers the quarterly period from September to November 2008. The objective of the bulletin is to provide early warning information on price changes of staple food commodities and their likely impact on the cost of the food basket. Price changes are determined for each country on a quarterly basis.

Highlights:

- Prices still remain significantly higher compared to last year and long term averages, especially in Eastern and Southern Africa, Asia and Middle East. Overall, the impact on the cost of the food basket remains relatively high.
- However, in most of the 36 countries monitored, prices of main staple food commodities have slightly declined over the last three months.
- West Africa: Staple food prices were generally stable during the last quarter, except in Benin and Senegal where prices have continued to rise-albeit at a lower rate. The year on year price changes remain higher than changes from long term averages.
- East and Southern Africa: The region shows a mixed picture. Half of the countries are still experiencing upward price trends, with significant maize price increases observed in Malawi and Kenya. Prices remain very high compared to their long run averages, especially in the Horn of Africa. The situation remains alarming in Zimbabwe due to hyperinflation.
- Asia and Selected Countries: Prices have either remained stable or declined, implying that the cost of food basket in these
 countries has declined more when compared to other regions such as Africa. However, they remain significantly higher in
 comparison to the long run averages.

Table 1 gives an overview of the price trends.

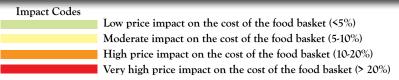

Table 2 provides more detailed figures by country and commodity.

Table 1: Price Trends for Main Staple Food Commodities (Change from Last Quarter)

	Downward ()	Stable ()	Upward ()
West & Central Africa		Burkina Faso Cote d'Ivoire Mali Mauritania Niger North Nigeria	Benin Senegal

	Tajikistan	5	Dushanbe, Gharm, Khorog, Kujand, Kurgan-Tyube.

Note: Data is collected and compiled by WFP country offices, mainly from government official price data sources

Annex 2: Approach

The analysis is based on quarterly price indices of the main caloric contributors to household food consumption. It uses:

- i) The most recent quarterly price change calculated as a percentage change from the precedent quarter. Real prices are calculated by dividing each quarterly price by its 5-year average. The change between the two quarters is reported in column E (Table 2).
- ii) The most recent (year-on-year) monthly price change calculated as a percentage change from 12 months earlier. Column F (Table 1) reflects the percentage change of the most recent monthly price data available (e.g. November 2008) compared with the same month of the previous year (i.e. November 2007).
- iii) The average (year-on-year) quarterly price changes in the current year calculated as the quarterly percentage changes from the corresponding seasonal price of last year, (Column G). This average percentage change indicates whether the price has changed from the recent quarter compared to the same quarter of the previous year.
- iv) The average (year-on-year) quarterly price changes in the current year calculated as the quarterly percentage change (say from September to November 2008) from the corresponding seasonal average prices of the last 5 years (Column H). This estimate indicates whether there is a structural shift of the current price from its long-term seasonal pattern.

The percentage changes of these quarterly price indices indicate the extent to which recent price changes can be considered normal or abnormal as compared to the quarter before. Column D displays the caloric contribution of each food item to households' total energy intake.

Assuming that the caloric contribution is a proxy of the relative importance of the food item in the food basket, the likely impact of the last quarter average monthly price change on the cost of the food basket is captured in column I (i.e. the percentage price change in column E weighted by the caloric contribution of the food item in column D). The likely impact of price changes is considered low when the estimated cumulative percentage impact on the cost of the food basket is below 5 percent (Column J). Between 5 percent and 10 percent it is considered moderate. Above 10 percent the likely impact on the cost of the food basket is considered high and very high above 20 percent. Households with diverse calorie sources are likely to be less affected by price rises than households with a single calorie source, unless significant price increases are witnessed for each major caloric contributor of the food basket.

While this approach can be used for early warning, results should be interpreted with caution as they do not capture the impact of the long term trend in food prices. Furthermore, the approach measures only direct impacts while an indirect impact is not accounted for. For instance, substitution and income effects due to price changes are disregarded. Similarly, it does not provide insights into the causes of the price increases. Finally, this approach does not account for the severity of the likely impact which may differ between households due to different incomes and food baskets by wealth or livelihoods groups and coping capacity.

Many thanks to WFP country offices for collecting, collating and sharing price datasets without which this bulletin would not be possible. Maize prices in Zimbabwe were converted in dollar terms, using the exchange rates of the parallel markets.
