Yemen

November 2015: Conflict and cyclones further aggravate food insecurity in Yemen

Key messages

- Two successive tropical cyclones hit Yemen’s southern coastal areas in November, worsening food consumption in Al Maharah and Abyan.

- November data shows that households in Taizz experienced a significant deterioration in food security – as seen by the drop in food consumption score and the more frequent use of negative coping strategies.

- IDP households had a deteriorating food consumption score and poorer diets than non-IDP households. More than 70 percent of IDP households resorted to food related coping mechanisms such as relying on less expensive foods, limiting portion sizes and reducing the number of meals consumed in a day.

- Households headed by women had poorer food consumption and higher coping levels than those headed by men.

Food consumption deteriorates in Al Maharah, Abyan, Ibb and Taizz.

The mean food consumption score (FCS) deteriorated in four governorates adversely affected by conflict and/or climatic conditions in November. Al Maharah and Abyan were hit by landfall cyclones that compromised households’ food consumption patterns; the mean FCS dropped from 71.7 to 55.8 ** in Al Maharah and from 55.6 to 49.5 * in Abyan since October.

November data also indicates worsening food consumption in Taizz and its neighbouring governorate Ibb, most likely induced by the persistence of conflict. In Taizz the mean FCS fell from 47.4 in October to 40.7 *, while in Ibb it dropped from 46.3 to 43.6 *. Coping levels slightly increased in Taizz from 18.1 in October to 18.4 in November *, signaling a worrying food security situation in the governorate. While the national mean FCS remained stable in November, internally displaced persons’ (IDP) food consumption deteriorated significantly *.

Food-related coping levels deteriorate in Taizz, while improving in Al Hudaydah, Al Jawf and Dhamar

The mean reduced Coping Strategies Index (rCSI) in November (18.4) remained similar to that of October (18.8) at the national level. However there was a significant - although likely temporary - decline in the use of negative food-related coping behaviour in Al Hudaydah, Al Jawf and Dhamar, most likely due to the increased seasonal availability of food and/or money to buy it from the sorghum and coffee harvest (Oct - Jan). On the contrary, coping levels slightly increased in Taizz.
November situation overview:

Yemen’s southern coastline was hit by two tropical cyclones in November 2015. According to the IOM Displacement Tracking Matrix (DTM), cyclones Chapala and Megh displaced about 5,974 families in Soqatra, Hadramaut, Shabwah, Abyan, Lahj and Al Maharah, and devastated infrastructures and crops. WFP and its partners have distributed food to affected populations in Shabwah and Hadramaut. The humanitarian situation in Taizz, where conflict has increased in recent months, remained critical.

Poor food consumption and high coping in the north-west and centre-south.

November data shows that nearly 45 percent of the total population had poor or borderline food consumption (21.2 percent and 23.6 percent respectively). As map 1 shows, in conflict prone governorates in the north-west (Al Jawf, Amran, Hajjah, Marib) and the centre-south (Taizz, Raymah, Dhamar, Al Dhale, Al Baydah) more than 25 percent of households had poor food consumption. In addition, many of those governorates had a mean rCSI above 20 (see map 2). By contrast, the FCS was better in governorates such as Lahj, Abyan and Aden, probably due to the ongoing emergency food assistance operations in the areas.

IDP households tended to have poorer diets and higher use of negative food-related coping strategies than non-IDP households. As figure 1 shows, nearly 60 percent of IDP households had poor or borderline food consumption compared with 43 percent of non-IDP households. Additionally, more than 70 percent of all surveyed IDPs relied on less expensive food, limited portion sizes and reduced the number of meals eaten each day.

November data suggests that households headed by women (sample size of 83 households), were more vulnerable to food insecurity (as measured by the FCS and the rCSI indicators) than those headed by men. Some 31 percent of households headed by women had poor food consumption, compared with 21 percent of households headed by men.

Increasing pessimism regarding food security across Yemen

The mean sentiment score dropped sharply from negative 0.18 in October to negative 0.31 in November at the national level. As seen in map 3, the perception of food security dropped drastically by negative 0.2 or more in the governorates largely affected by conflict and/or cyclones, i.e., Al Baydah, Raymah, Al Maharah and Hadramaut.

Survey respondents reported a difficult and deteriorating food security situation. The words ‘bad/difficult’, ‘poor’, and the need of ‘aid’ have increased by 13, 3 and 2 percent respectively since October. Reports about the unavailability of basic food commodities, water, cooking gas and job opportunities were consistent with the findings from WFP market monitoring in November. In Taizz, respondents emphasized that conflict was intensifying water shortages and electricity breakdowns, while in Al Maharah respondents reported that flooding had prompted sharp increases in food prices and food shortages.
In the words of the respondents:

- “The food situation is very bad. Basic food commodities are not available. Electricity is continuously interrupted.” (Male respondent from Sana’a city)
- “The food situation is very bad and there is a lack of paid work in the region.” (Female respondent from Taizz)
- “There are severe floods because of the hurricane and there is no way to bring food.” (Male respondent from Al Maharah)
- “The food situation is deteriorating and there are no food supplies available.” (Male respondent from Al Dhale)
- “The food situation is bad, prices are high, there is neither gas, nor electricity.” (Male respondent from Taizz)

Methodology – mVAM remote mobile data collection

High levels of insecurity in Yemen currently prevent the implementation of traditional face-to-face surveys. In order to monitor the impact of the conflict on food security, WFP uses mobile VAM, its remote mobile data collection tool. In November, WFP concluded its fourth survey round. Calls targeted all mobile operators in Yemen and used random-digit dialing. The data presented here was collected from a sample of 2435 respondents from 21 governorates. More than one third of respondents were internally displaced.

mVAM surveys in Yemen collect two food insecurity indicators: the food consumption score and the reduced coping strategies index – a measure of food-based coping - and analyse answers to an open-ended question on the food security situation in the respondent’s community. To analyse these responses, we calculate the “polarity” of each response through computer algorithm scores that measure how positive/negative the statement is on a scale of -1.0 (very negative) to +1.0 (very positive). Aggregate data tables are available on the mVAM page.

Limitations: owing to the partial nature of mobile phone access in Yemen (68 subscriptions per 100 people in 2014 according to the World Bank) and the low electricity access rate, data collection by mobile phone involves biases. Responses are likely to be biased towards younger, somewhat better-off households who live in urban areas and have better access to electricity and phone charging services. According to data from the Yemen Comprehensive Food Security Survey 2014, 72 percent of the population in the poorest quintile does not own a mobile phone, which indicates that mobile phone surveys would be biased towards better-off households. We account for such biases as we interpret our results. Details on methodology are available online.
Methodological Note: Reporting on statistical tests and significance level

To report the level of statistical significance, the following reference is used:
